

GWR dia.O7 "Siphon F" 40ft Milk Van

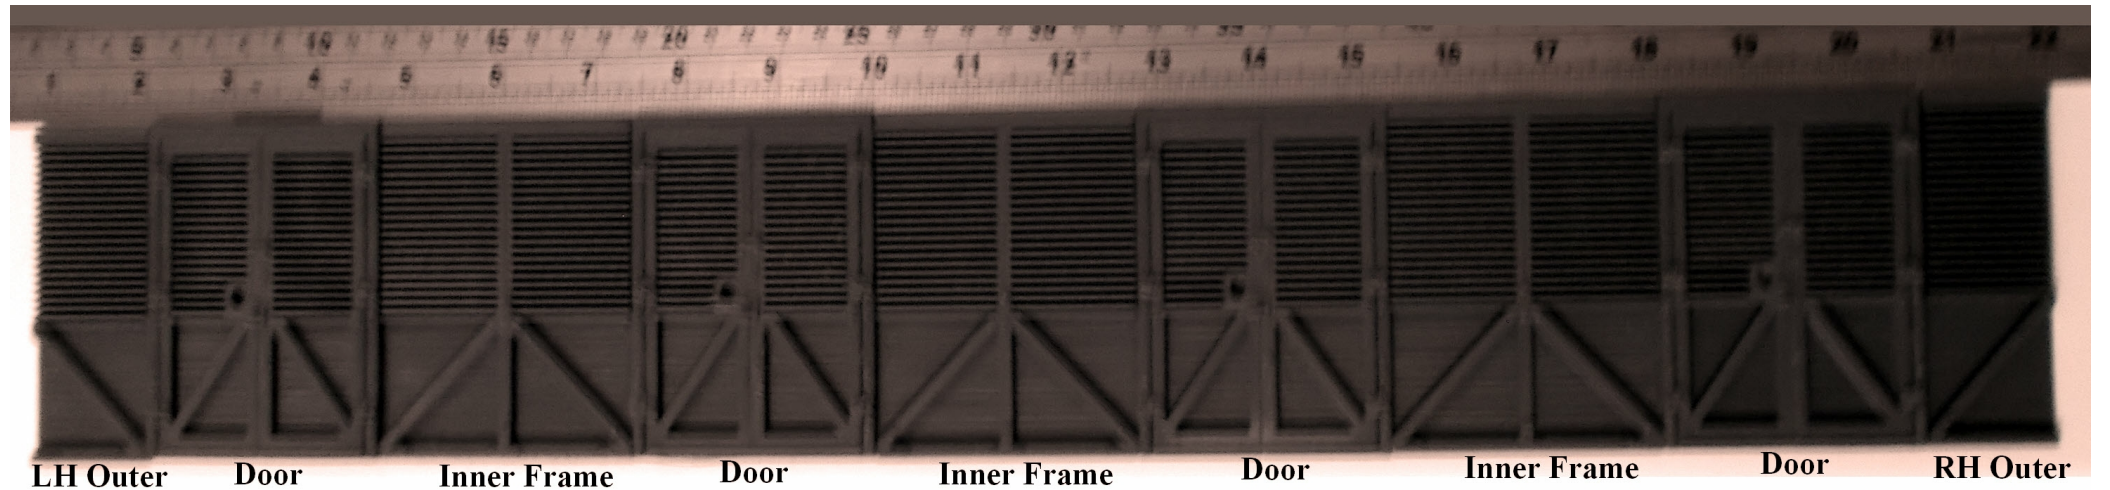

The layout of the side components is shown below (the sides fit **between** the ends).

Only six were built to this diagram in 1906 and when built they ran on 9ft volute spring bogies but most were replaced with the "American" 9ft equaliser beam type but a couple later ran on 7ft Collett bogies ... details in HMRS publication "GW Siphons".

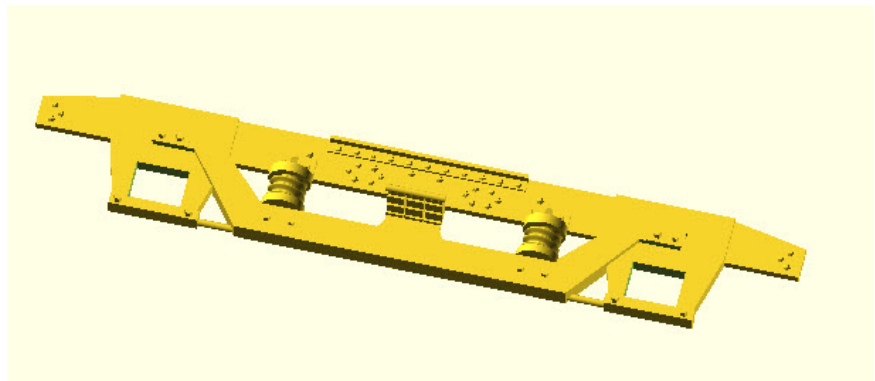

Parts for bogie sideframes for the 9ft "American" and Collett 7ft are available to download (link accessible from the Siphon index page).

It is recommended that the printed parts are fitted onto 3mm plywood (or similar) to form a strong box.

The file for printing the tri-arc roof is will be provided soon, alternatively you can make from stripwood or plastic card.

9ft American Bogie

7ft Collett Bogie
